September 2023 Release

Release Notes

The MetaFarms software release will be implemented on September 26, 2023. **100%** of the below features and defects came from feedback from our customers. Please be sure to continue with your questions/comments on this release and any future enhancements you would like to see!

Below are some of the enhancements available and defects that were fixed.

Note: Additions to reports can result in changing column headers and may affect any macros you have for that report. To help reduce the impact on custom written macros, we suggest users unhide Row 1 and reference the column name vs referencing the letter of the column in the macro.

New columns added to reports will be visible in the MetaFarms Full version and hidden in the MetaFarms Summary version.

Release Features

API

Feature 3350 – PICTraq API - Add Parity to the API call to PIC

Parity has now been added to the PICTraq API being sent to PIC.

Release Defects

Finance

Defect 3248 – Export Market Sales to Great Plains Errors Out

Fixed an issue where if the Sales Account was greater than 10 characters, the report would error out. Increased the length to 50 to cause the report to run without error.

Feed

Defect 3383 – Feed Budget Comparison Report - Variance % Calculation is Wrong

Fixed the calculation of the Variance % Total on the Feed Budget Comparison Report by using the Budget Total Lb. to Feed vs the Actual Total Lb. Fed.

Sow

Defect 2512 – Estrus Analysis - Bug for Wean to First Service Interval

Fixed an issue on the Estrus Analysis Report where the wean to first service for animals that are aborted, nursed on, and then weaned and get mated again. We are now looking at the wean date of the next mating.

Defect 3371 – Sow Correction Report - Mobile Errors

Fixed an issue where the cutoff week for the report didn't stop newer sow corrections from being included in the report.

Defect 3382 – Sow Data Entry Screen - Need to Limit the String Length on Avg. Weight Field

Fixed an issue where the average weight for farrows and weans was inadvertently entered much too high without an error. It will now be flagged with an error.

Sow Mobile

Defect 3247 – Sow Mobile Validation of Weans

Fixed an issue where multiple wean events would post to a sow for the same day when site defaults had certain validations turned on.

Defect 3355 – Sow Mobile Force Save

Fixed an issue where users were utilizing rapid entry functionality but not before entering a sow tag via event entry, therefore all events were posted to one Sow ID. There is now a record for each sow tag regardless of point of entry: event entry or rapid entry.

Defect 3356 – Sow Mobile Incorrect Sow ID Sow Card Report

Fixed an issue where the QR Code had the incorrect Sow tag for the following formats of the Sow Cards: 2 cards per page history only (mini format), 2 cards per page history only (mini format 2), and 1 card per page mini format 3.

Sincerely,

Your MetaFarms Customer Support/Account Services Team
